

## **Permeable Pavement Maintenance**

- **Keep pavement free of soil, mulch, grass clippings, leaves and like materials.**
- **Remove any weeds.**
- **Do not use sand for winter maintenance. Sand will contribute to clogging. If traction “grit” is needed spread #9 stone.**
- **Visually monitor pavement infiltration of water during periods of rainfall. Larger jobs should have observation wells installed to observe how well the system is functioning.**
- **Crusting of sediment in the joints or any ponding of water are indicators that vacuuming and replacement of the open graded joint material may be needed. BMP (Best Management Practices) suggest that vacuuming once or twice a year will keep the permeable system operating at a high infiltration level for many years.**

**Consult the Whitacre Greer “Winter Sidewalk Maintenance” and “General Purpose Maintenance” document for additional information.**
